

iOS Introduction

2.1 Introduction and Overview

Liquid UI for iOS is a reimagination of SAP GUI, built with touch and mobility, works seamlessly anywhere and anytime. Leveraging Liquid UI technology, users gain access to native SAP transactions while also having the flexibility to create customized transactions through the Developer Toolkit. These custom transactions can be deployed via the Liquid UI Server, requiring an Enterprise License, which offers additional user features.

Liquid UI for iOS is a natively built application that does not require web browsers or third-party middleware. Built upon the industry-standard Liquid UI platform, it facilitates screen customizations without altering business logic or necessitating the writing of ABAP code.

We provide complete user documentation for the current Liquid UI for iOS clients. For information on limitations and known issues, please refer to the [Release Notes](#) specific to this version. However, there are other components in the Liquid UI solution. These are covered in their dedicated documents.

Note: Before using the client, ensure it's configured on your **SAP Application Server** or a **Liquid UI Server**.

Please refer to the [Client Configuration](#) section for more details on configuring the client.

If you have an Enterprise License, refer to the [Server Configuration](#) section.

Unique solution ID: #1404
